

One needs the functions from `mathmlPlot` in `examples/`.

1a  $\langle * 1a \rangle \equiv$   
`inFile <- system.file("data/mathmlQuadratic.xml", "XML")`  
`d <- xmlTreeParse(inFile)`  
`plot(1:10, type="n")`  
`text(5,5, mathmlPlot(d))`

1b  $\langle 1b \rangle \equiv$   
`u <- xmlTreeParse("data/mathmlRoot.xml")`  
`text(5,7,mathmlPlot(u))`

1c  $\langle 1b \rangle + \equiv$   
`u <- xmlTreeParse("data/mathmlSet.xml")`  
`text(5,9,mathmlPlot(u))`

$\langle 1b \rangle$   
 $\langle * 1a \rangle$
