RFC 9641

A YANG Data Model for a Truststore

Abstract

This document presents a YANG module for configuring bags of certificates and bags of public keys that can be referenced by other data models for trust. Notifications are sent when certificates are about to expire.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9641>.

1. Introduction

This document presents a YANG 1.1 [\[RFC7950\]](#) module that has the following characteristics:

- Provide a central truststore for storing raw public keys and/or certificates.

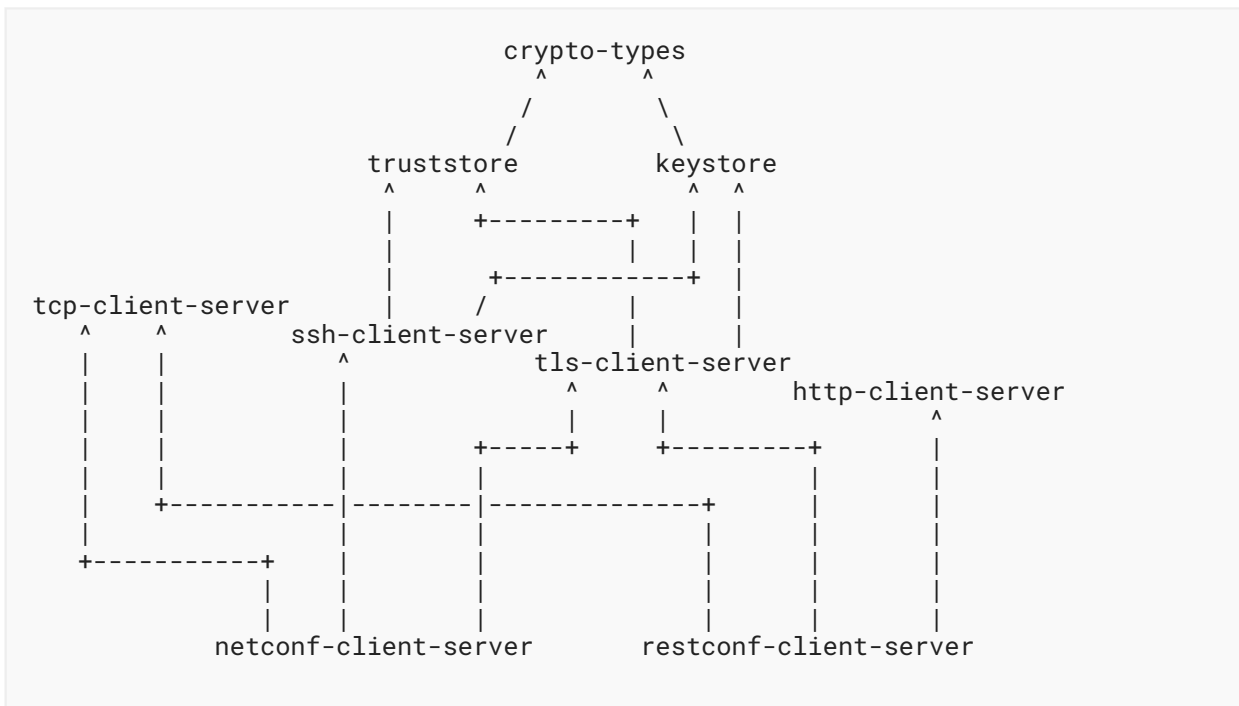

- Provide support for storing named bags of raw public keys and/or named bags of certificates.
- Provide types that can be used to reference raw public keys or certificates stored in the central truststore.
- Provide groupings that enable raw public keys and certificates to be configured inline or as references to truststore instances.
- Enable the truststore to be instantiated in other data models, in addition to or in lieu of the central truststore instance.

1.1. Relation to Other RFCs

This document presents a YANG module [RFC7950] that is part of a collection of RFCs that work together to ultimately support the configuration of both the clients and servers of both the Network Configuration Protocol (NETCONF) [RFC6241] and RESTCONF [RFC8040].

The dependency relationship between the primary YANG groupings defined in the various RFCs is presented in the below diagram. In some cases, a document may define secondary groupings that introduce dependencies not illustrated in the diagram. The labels in the diagram are shorthand names for the defining RFCs. The citation references for shorthand names are provided below the diagram.

Please note that the arrows in the diagram point from referencer to referenced. For example, the "crypto-types" RFC does not have any dependencies, whilst the "keystore" RFC depends on the "crypto-types" RFC.

Label in Diagram	Reference
------------------	-----------

crypto-types	[RFC9640]
truststore	RFC 9641
keystore	[RFC9642]
tcp-client-server	[RFC9643]
ssh-client-server	[RFC9644]
tls-client-server	[RFC9645]
http-client-server	[HTTP-CLIENT-SERVER]
netconf-client-server	[NETCONF-CLIENT-SERVER]
restconf-client-server	[RESTCONF-CLIENT-SERVER]

Table 1: Label in Diagram to RFC Mapping

1.2. Specification Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

1.3. Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [RFC8342]. For instance, trust anchors installed during manufacturing (e.g., for trusted, well-known services) are expected to appear in <operational> (see Section 3).

1.4. Conventions

Various examples in this document use "BASE64VALUE=" as a placeholder value for binary data that has been base64 encoded (see Section 9.8 of [RFC7950]). This placeholder value is used because real base64-encoded structures are often many lines long and hence distracting to the example being presented.

Various examples in this document use the XML [W3C.REC-xml-20081126] encoding. Other encodings, such as JSON [RFC8259], could alternatively be used.

Various examples in this document contain long lines that may be folded, as described in [RFC8792].

This document uses the adjective "central" with the word "truststore" to refer to the top-level instance of the "truststore-grouping" grouping when the "central-truststore-supported" feature is enabled. Please be aware that consuming YANG modules **MAY** instantiate the "truststore-grouping" grouping in other locations. All such other instances are not the "central" instance.

2. The "ietf-truststore" Module

This section defines a YANG 1.1 [RFC7950] module called "ietf-truststore". A high-level overview of the module is provided in [Section 2.1](#). Examples illustrating the module's use are provided in [Section 2.2](#) ("Example Usage"). The YANG module itself is defined in [Section 2.3](#).

2.1. Data Model Overview

This section provides an overview of the "ietf-truststore" module in terms of its features, typedefs, groupings, and protocol-accessible nodes.

2.1.1. Features

The following diagram lists all the "feature" statements defined in the "ietf-truststore" module:

```
Features:
  +-- central-truststore-supported
  +-- inline-definitions-supported
  +-- certificates
  +-- public-keys
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

2.1.2. Typedefs

The following diagram lists the "typedef" statements defined in the "ietf-truststore" module:

```
Typedefs:
  leafref
  +-- central-certificate-bag-ref
  +-- central-certificate-ref
  +-- central-public-key-bag-ref
  +-- central-public-key-ref
```

The diagram above uses syntax that is similar to but not defined in [\[RFC8340\]](#).

Comments:

- All the typedefs defined in the "ietf-truststore" module extend the base "leafref" type defined in [\[RFC7950\]](#).
- The leafrefs refer to certificates, public keys, and bags in the central truststore when this module is implemented.

- These typedefs are provided to aid consuming modules that import the "ietf-truststore" module.

2.1.3. Groupings

The "ietf-truststore" module defines the following "grouping" statements:

- central-certificate-ref-grouping
- central-public-key-ref-grouping
- inline-or-truststore-certs-grouping
- inline-or-truststore-public-keys-grouping
- truststore-grouping

Each of these groupings are presented in the following subsections.

2.1.3.1. The "central-certificate-ref-grouping" Grouping

The following tree diagram [RFC8340] illustrates the "central-certificate-ref-grouping" grouping:

```
grouping central-certificate-ref-grouping:
  +-- certificate-bag?   ts:central-certificate-bag-ref
  |   {central-truststore-supported, certificates}?
  +-- certificate?      ts:central-certificate-ref
  |   {central-truststore-supported, certificates}?
```

Comments:

- The "central-certificate-ref-grouping" grouping is provided solely as a convenience to consuming modules that wish to enable the configuration of a reference to a certificate in a certificate-bag in the truststore.
- The "certificate-bag" leaf uses the "central-certificate-bag-ref" typedef defined in [Section 2.1.2](#).
- The "certificate" leaf uses the "central-certificate-ref" typedef defined in [Section 2.1.2](#).

2.1.3.2. The "central-public-key-ref-grouping" Grouping

The following tree diagram [RFC8340] illustrates the "central-public-key-ref-grouping" grouping:

```
grouping central-public-key-ref-grouping:
  +-- public-key-bag?   ts:central-public-key-bag-ref
  |   {central-truststore-supported, public-keys}?
  +-- public-key?      ts:central-public-key-ref
  |   {central-truststore-supported, public-keys}?
```

Comments:

- The "central-public-key-ref-grouping" grouping is provided solely as a convenience to consuming modules that wish to enable the configuration of a reference to a public-key in a public-key-bag in the truststore.
- The "public-key-bag" leaf uses the "central-public-key-bag-ref" typedef defined in [Section 2.1.2](#).
- The "public-key" leaf uses the "central-public-key-ref" typedef defined in [Section 2.1.2](#).

2.1.3.3. The "inline-or-truststore-certs-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "inline-or-truststore-certs-grouping" grouping:

```

grouping inline-or-truststore-certs-grouping:
  +-- (inline-or-truststore)
    +--:(inline) {inline-definitions-supported}?
      | +-- inline-definition
      |   +-- certificate* [name]
      |       +-- name                               string
      |       +---u ct:trust-anchor-cert-grouping
    +--:(central-truststore)
      {central-truststore-supported,certificates}?
      +-- central-truststore-reference?
          ts:central-certificate-bag-ref
  
```

Comments:

- The "inline-or-truststore-certs-grouping" grouping is provided solely as a convenience to consuming modules that wish to offer an option whether a bag of certificates can be defined inline or as a reference to a bag in the truststore.
- A "choice" statement is used to expose the various options. Each option is enabled by a "feature" statement. Additional "case" statements **MAY** be augmented in if, e.g., there is a need to reference a bag in an alternate location.
- For the "inline-definition" option, the "certificate" node uses the "trust-anchor-cert-grouping" grouping discussed in [Section 2.1.4.8](#) of [[RFC9640](#)].
- For the "central-truststore" option, the "central-truststore-reference" node is an instance of the "central-certificate-bag-ref" discussed in [Section 2.1.2](#).

2.1.3.4. The "inline-or-truststore-public-keys-grouping" Grouping

The following tree diagram [[RFC8340](#)] illustrates the "inline-or-truststore-public-keys-grouping" grouping:

```

grouping inline-or-truststore-public-keys-grouping:
  +-- (inline-or-truststore)
    +--:(inline) {inline-definitions-supported}?
      | +-- inline-definition
      |   +-- public-key* [name]
      |     +-- name string
      |     +---u ct:public-key-grouping
    +--:(central-truststore)
      {central-truststore-supported,public-keys}?
      +-- central-truststore-reference?
          ts:central-public-key-bag-ref

```

Comments:

- The "inline-or-truststore-public-keys-grouping" grouping is provided solely as a convenience to consuming modules that wish to offer an option whether a bag of public keys can be defined inline or as a reference to a bag in the truststore.
- A "choice" statement is used to expose the various options. Each option is enabled by a "feature" statement. Additional "case" statements **MAY** be augmented in if, e.g., there is a need to reference a bag in an alternate location.
- For the "inline-definition" option, the "public-key" node uses the "public-key-grouping" grouping discussed in [Section 2.1.4.4](#) of [RFC9640].
- For the "central-truststore" option, the "central-truststore-reference" is an instance of the "certificate-bag-ref" discussed in [Section 2.1.2](#).

2.1.3.5. The "truststore-grouping" Grouping

The following tree diagram [RFC8340] illustrates the "truststore-grouping" grouping:

```

grouping truststore-grouping:
  +-- certificate-bags {certificates}?
    | +-- certificate-bag* [name]
    |   +-- name string
    |   +-- description? string
    |   +-- certificate* [name]
    |     +-- name string
    |     +---u ct:trust-anchor-cert-grouping
  +-- public-key-bags {public-keys}?
    +-- public-key-bag* [name]
      +-- name string
      +-- description? string
      +-- public-key* [name]
        +-- name string
        +---u ct:public-key-grouping

```

Comments:

- The "truststore-grouping" grouping defines a truststore instance as being composed of certificates and/or public keys, both of which are enabled by "feature" statements. The structures supporting certificates and public keys are essentially the same, having an outer

list of "bags" containing an inner list of objects (i.e., certificates or public keys). The bags enable trust anchors serving a common purpose to be grouped and referenced together.

- For certificates, each certificate is defined by the "trust-anchor-cert-grouping" grouping (Section 2.1.4.8 of [RFC9640]). The "cert-data" node is a Cryptographic Message Syntax (CMS) structure that can be composed of a chain of one or more certificates. Additionally, the "certificate-expiration" notification enables the server to alert clients when certificates are nearing expiration or have already expired.
- For public keys, each public key is defined by the "public-key-grouping" grouping (Section 2.1.4.4 of [RFC9640]). The "public-key" node can be one of any number of structures specified by the "public-key-format" identity node.

2.1.4. Protocol-Accessible Nodes

The following tree diagram [RFC8340] lists all the protocol-accessible nodes defined in the "ietf-truststore" module without expanding the "grouping" statements:

```

module: ietf-truststore
  +--rw truststore {central-truststore-supported}?
    +---u truststore-grouping
  
```

The following tree diagram [RFC8340] lists all the protocol-accessible nodes defined in the "ietf-truststore" module with all "grouping" statements expanded, enabling the truststore's full structure to be seen:

```

module: ietf-truststore
  +--rw truststore {central-truststore-supported}?
    +--rw certificate-bags {certificates}?
      | +--rw certificate-bag* [name]
      |   +--rw name          string
      |   +--rw description?  string
      |   +--rw certificate* [name]
      |     +--rw name          string
      |     +--rw cert-data    trust-anchor-cert-cms
      |     +---n certificate-expiration
      |       {certificate-expiration-notification}?
      |       +-- expiration-date yang:date-and-time
    +--rw public-key-bags {public-keys}?
      +--rw public-key-bag* [name]
        +--rw name          string
        +--rw description?  string
        +--rw public-key* [name]
          +--rw name          string
          +--rw public-key-format identityref
          +--rw public-key    binary
  
```

Comments:

- Protocol-accessible nodes are those nodes that are accessible when the module is "implemented", as described in Section 5.6.5 of [RFC7950].

- The protocol-accessible nodes for the "ietf-truststore" module are instances of the "truststore-grouping" grouping discussed in [Section 2.1.3.5](#).
- The top-level "truststore" node is additionally constrained by the "central-truststore-supported" feature.
- The "truststore-grouping" grouping is discussed in [Section 2.1.3.5](#).
- The reason for why the "truststore-grouping" grouping exists separate from the protocol-accessible nodes definition is to enable instances of the truststore to be instantiated in other locations, as may be needed or desired by some modules.

2.2. Example Usage

The examples in this section are encoded using XML, such as might be the case when using the NETCONF protocol. Other encodings **MAY** be used, such as JSON when using the RESTCONF protocol.

2.2.1. A Truststore Instance

This section presents an example illustrating trust anchors in <intended>, as per [Section 2.1.4](#). Please see [Section 3](#) for an example illustrating built-in values in <operational>.

The example contained in this section defines eight bags of trust anchors. There are four certificate-based bags and four public-key-based bags. The following diagram provides an overview of the contents in the example:

```
Certificate Bags
+-- Trust anchor certs for authenticating a set of remote servers
+-- End entity certs for authenticating a set of remote servers
+-- Trust anchor certs for authenticating a set of remote clients
+-- End entity certs for authenticating a set of remote clients

Public Key Bags
+-- SSH keys to authenticate a set of remote SSH servers
+-- SSH keys to authenticate a set of remote SSH clients
+-- Raw public keys to authenticate a set of remote SSH servers
+-- Raw public keys to authenticate a set of remote SSH clients
```

```
===== NOTE: '\' line wrapping per RFC 8792 =====

2.2.2. A Certificate Expiration Notification

The following example illustrates the "certificate-expiration" notification (per [Section 2.1.4.7](#) of [RFC9640](#)) for a certificate configured in the truststore described in [Section 2.2.1](#).

```

===== NOTE: '\' line wrapping per RFC 8792 =====

<notification
  xmlns="urn:ietf:params:xml:ns:netconf:notification:1.0">
  <eventTime>2018-05-25T00:01:00Z</eventTime>
  <truststore xmlns="urn:ietf:params:xml:ns:yang:ietf-truststore">
    <certificate-bags>
      <certificate-bag>
        <name>trusted-client-ee-certs</name>
        <certificate>
          <name>George Jetson</name>
          <certificate-expiration>
            <expiration-date>2024-01-05T14:18:53-05:00</expiration-d\
ate>
          </certificate-expiration>
        </certificate>
      </certificate-bag>
    </certificate-bags>
  </truststore>
</notification>

```

2.2.3. The "Inline or Truststore" Groupings

This section illustrates the various "inline-or-truststore" groupings defined in the "ietf-truststore" module, specifically the "inline-or-truststore-certs-grouping" ([Section 2.1.3.3](#)) and "inline-or-truststore-public-keys-grouping" ([Section 2.1.3.4](#)) groupings.

These examples assume the existence of an example module called "ex-truststore-usage" that has the namespace "https://example.com/ns/example-truststore-usage".

The "ex-truststore-usage" module is first presented using tree diagrams [[RFC8340](#)], followed by an instance example illustrating all the "inline-or-truststore" groupings in use, followed by the YANG module itself.

The following tree diagram illustrates the "ex-truststore-usage" module without expanding the "grouping" statements:

```

module: ex-truststore-usage
  +--rw truststore-usage
    +--rw cert* [name]
      | +--rw name string
      | +---u ts:inline-or-truststore-certs-grouping
    +--rw public-key* [name]
      +--rw name string
      +---u ts:inline-or-truststore-public-keys-grouping

```

The following tree diagram illustrates the "ex-truststore-usage" module with all "grouping" statements expanded, enabling the truststore's full structure to be seen:

```

module: ex-truststore-usage
  +--rw truststore-usage
    +--rw cert* [name]
      | +--rw name string
      | +--rw (inline-or-truststore)
      | +--:(inline) {inline-definitions-supported}?
      | | +--rw inline-definition
      | | | +--rw certificate* [name]
      | | | | +--rw name string
      | | | | +--rw cert-data
      | | | | | trust-anchor-cert-cms
      | | | | +---n certificate-expiration

```

The following example provides two equivalent instances of each grouping, the first being a reference to a truststore and the second being defined inline. The instance having a reference to a truststore is consistent with the truststore defined in [Section 2.2.1](#). The two instances are equivalent, as the inlined instance example contains the same values defined by the truststore instance referenced by its sibling example.

```

===== NOTE: '\ ' line wrapping per RFC 8792 =====

3. Support for Built-In Trust Anchors

In some implementations, a server may define some built-in trust anchors. For instance, there may be built-in trust anchors enabling the server to securely connect to well-known services (e.g., a Secure Zero-Touch Provisioning (SZTP) [\[RFC8572\]](#) bootstrap server) or public Certification Authority (CA) certificates to connect to arbitrary web services using PKI.

Built-in trust anchors are expected to be set by a vendor-specific process. Any ability for operators to set and/or modify built-in trust anchors is outside the scope of this document.

The primary characteristic of the built-in trust anchors is that they are provided by the server, as opposed to configuration. As such, they are present in <operational> (Section 5.3 of [RFC8342]) and <system> [NETMOD-SYSTEM-CONFIG], if implemented.

The example below illustrates what the truststore in <operational> might look like for a server in its factory default state. Note that the built-in trust anchor bags have the "or:origin" annotation value "or:system".

```
<truststore
  xmlns="urn:ietf:params:xml:ns:yang:ietf-truststore"
  xmlns:ct="urn:ietf:params:xml:ns:yang:ietf-crypto-types"
  xmlns:or="urn:ietf:params:xml:ns:yang:ietf-origin"
  or:origin="or:intended">
  <certificate-bags>

    <certificate-bag or:origin="or:system">
      <name>Built-In Manufacturer Trust Anchor Certificates</name>
      <description>
        Certificates built into the device for authenticating
        manufacturer-signed objects, such as TLS server certificates,
        vouchers, etc.
      </description>
      <certificate>
        <name>Manufacturer Root CA Cert</name>
        <cert-data>BASE64VALUE=</cert-data>
      </certificate>
    </certificate-bag>

    <certificate-bag or:origin="or:system">
      <name>Built-In Public Trust Anchor Certificates</name>
      <description>
        Certificates built into the device for authenticating
        certificates issued by public certificate authorities,
        such as the end-entity certificate for web servers.
      </description>
      <certificate>
        <name>Public Root CA Cert 1</name>
        <cert-data>BASE64VALUE=</cert-data>
      </certificate>
      <certificate>
        <name>Public Root CA Cert 2</name>
        <cert-data>BASE64VALUE=</cert-data>
      </certificate>
      <certificate>
        <name>Public Root CA Cert 3</name>
        <cert-data>BASE64VALUE=</cert-data>
      </certificate>
    </certificate-bag>

  </certificate-bags>
</truststore>
```

4. Security Considerations

4.1. Security of Data at Rest

The YANG module specified in this document defines a mechanism called a "truststore" that, by its name, suggests that its contents are protected from unauthorized modification.

Security controls for the API (i.e., data in motion) are discussed in [Section 4.3](#), but controls for the data at rest (e.g., on disk) cannot be specified by the YANG module.

In order to satisfy the expectations of a "truststore", server implementations **MUST** ensure that the truststore contents are protected from unauthorized modifications when at rest.

4.2. Unconstrained Public Key Usage

This module enables the configuration of public keys without constraints on their usage, e.g., what operations the key is allowed to be used for (encryption, verification, or both).

Trust anchors configured via this module are implicitly trusted to validate certification paths that may include any name, be used for any purpose, or be subject to constraints imposed by an intermediate CA or by context in which the truststore is used. Implementations are free to use alternative or auxiliary structures and validation rules to define constraints that limit the applicability of a trust anchor.

4.3. Considerations for the "ietf-truststore" YANG Module

This section is modeled after the template defined in [Section 3.7.1](#) of [\[RFC8407\]](#).

The "ietf-truststore" YANG module defines "grouping" and "container" statements that are designed to be accessed via YANG-based management protocols, such as NETCONF [\[RFC6241\]](#) and RESTCONF [\[RFC8040\]](#). These protocols have mandatory-to-implement secure transport layers (e.g., Secure Shell (SSH) [\[RFC4252\]](#), TLS [\[RFC8446\]](#), and QUIC [\[RFC9000\]](#)) and mandatory-to-implement mutual authentication.

The Network Configuration Access Control Model (NACM) [\[RFC8341\]](#) provides the means to restrict access for particular users to a preconfigured subset of all available protocol operations and content.

Please be aware that this YANG module uses groupings from other YANG modules that define nodes that may be considered sensitive or vulnerable in network environments. Please review the security considerations for dependent YANG modules for information as to which nodes may be considered sensitive or vulnerable in network environments.

Most of the readable data nodes defined in this YANG module are not considered sensitive or vulnerable in network environments. However, the "cert-data" node uses the NACM "default-deny-all" extension for reasons described in [Section 3.8](#) of [\[RFC9640\]](#).

All the writable data nodes defined by this module, both in the "grouping" statements as well as the protocol-accessible "truststore" instance, may be considered sensitive or vulnerable in some network environments. For instance, any modification to a trust anchor or reference to a trust anchor may dramatically alter the implemented security policy. For this reason, the NACM "default-deny-write" extension has been set for all data nodes defined in this module.

This module does not define any "rpc" or "action" statements, and thus, the security considerations for such are not provided here.

5. IANA Considerations

5.1. The IETF XML Registry

IANA has registered the following URI in the "ns" registry defined of the "IETF XML Registry" [[RFC3688](#)].

URI: urn:ietf:params:xml:ns:yang:ietf-truststore
Registrant Contact: The IESG
XML: N/A; the requested URI is an XML namespace.

5.2. The YANG Module Names Registry

IANA has registered the following YANG module in the "YANG Module Names" registry defined in [[RFC6020](#)].

Name: ietf-truststore
Namespace: urn:ietf:params:xml:ns:yang:ietf-truststore
Prefix: ts
Reference: RFC 9641

Acknowledgements

The authors especially thank Henk Birkholz for contributing YANG to the "ietf-truststore" module supporting raw public keys and PSKs (pre-shared or pairwise-symmetric keys). While these contributions were eventually replaced by reusing the existing support for asymmetric and symmetric trust anchors, respectively, it was only through Henk's initiative that the WG was able to come to that result.

The authors additionally thank the following for helping give shape to this work (ordered by first name): Balázs Kovács, Carl Wallace, Eric Voit, Éric Vyncke, Francesca Palombini, Jensen Zhang, Jürgen Schönwälder, Lars Eggert, Liang Xia, Martin Björklund, Murray Kucherawy, Nick Hancock, Paul Kyzivat, Qin Wu, Rob Wilton, Robert Varga, Roman Danyliw, and Yoav Nir.
